UNIT DESCRIPTIONS

QUATERNARY SYSTEM

RECENT

OAHE FORMATION

- Qe** **Excavations**
Excavations, typically small (less than a few acre), many of which are visible on 1938 aerial photographs, into mudstone or sandstone of the Cannonball Formation.
- Qf** **Construction Fill**
Fill material mapped off of 1960 circa aerial photographs.
- Qls** **Landslide Deposits**
Sedimentary rock disturbed (out of place) due to slope failure.
- Qld** **Garbage Dump**
Municipal waste that was routinely burned after it had been dumped in a hole or onto a pile.
- Qiw** **Industrial Dump**
Area underlain by buried or mounded industrial waste (flyash).
- Qal** **Alluvium**
Sand, silt, clay, and occasionally gravel deposited under fluvial conditions (by a river or creek). Organic content is variable but often contain paleosols (ancient soil horizons). Bedding typically ranges from small scale cross-bedding to planar to obscurely bedded. These deposits, which range from a few feet up to 70 feet in thickness, are found within the flood plain of the Heart and Missouri rivers and associated tributaries and drainages. These areas routinely flooded prior to the advent of protective dikes and the Lake Tschida and Garrison dams. In the Heart River floodplain, it is underlain by 50-60 feet of Qat deposits.
- Qp** **Pond Sediment**
Ponded sediments, typically organic rich silts and clays, occasionally laminated.

HOLOCENE/PLEISTOCENE

- Qat** **Alluvial Terrace Deposits**
Silt, sand, and occasionally thin beds of gravel up to 80 feet thick deposited in two or three Heart River terraces and one terrace of the Missouri River. Typically consists of 20 feet of basal gravel overlain and sometimes obscured by alternating layers of windblown deposits of fine to coarse grained, crossbedded sand and silt. Primarily deposited during the Pleistocene. Ranges in elevation between 1650 and 1750 feet.

PLEISTOCENE

COLEHARBOR GROUP

- Qg** **Glacial Till**
Consisting primarily of till, a poorly sorted mixture of clay, silt, sand, pebbles, and cobbles transported and deposited primarily as a subglacial deposit. Occasionally will contain lenses of sand and gravel. Typically highly fractured, weathered, and less than 20 feet thick in the area.

TERTIARY SYSTEM

PALEOCENE

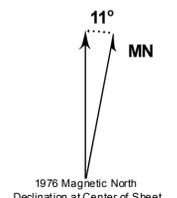

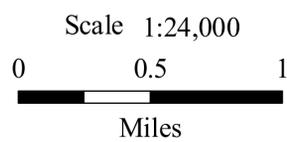

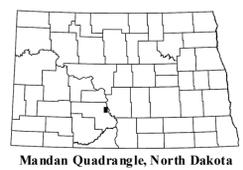

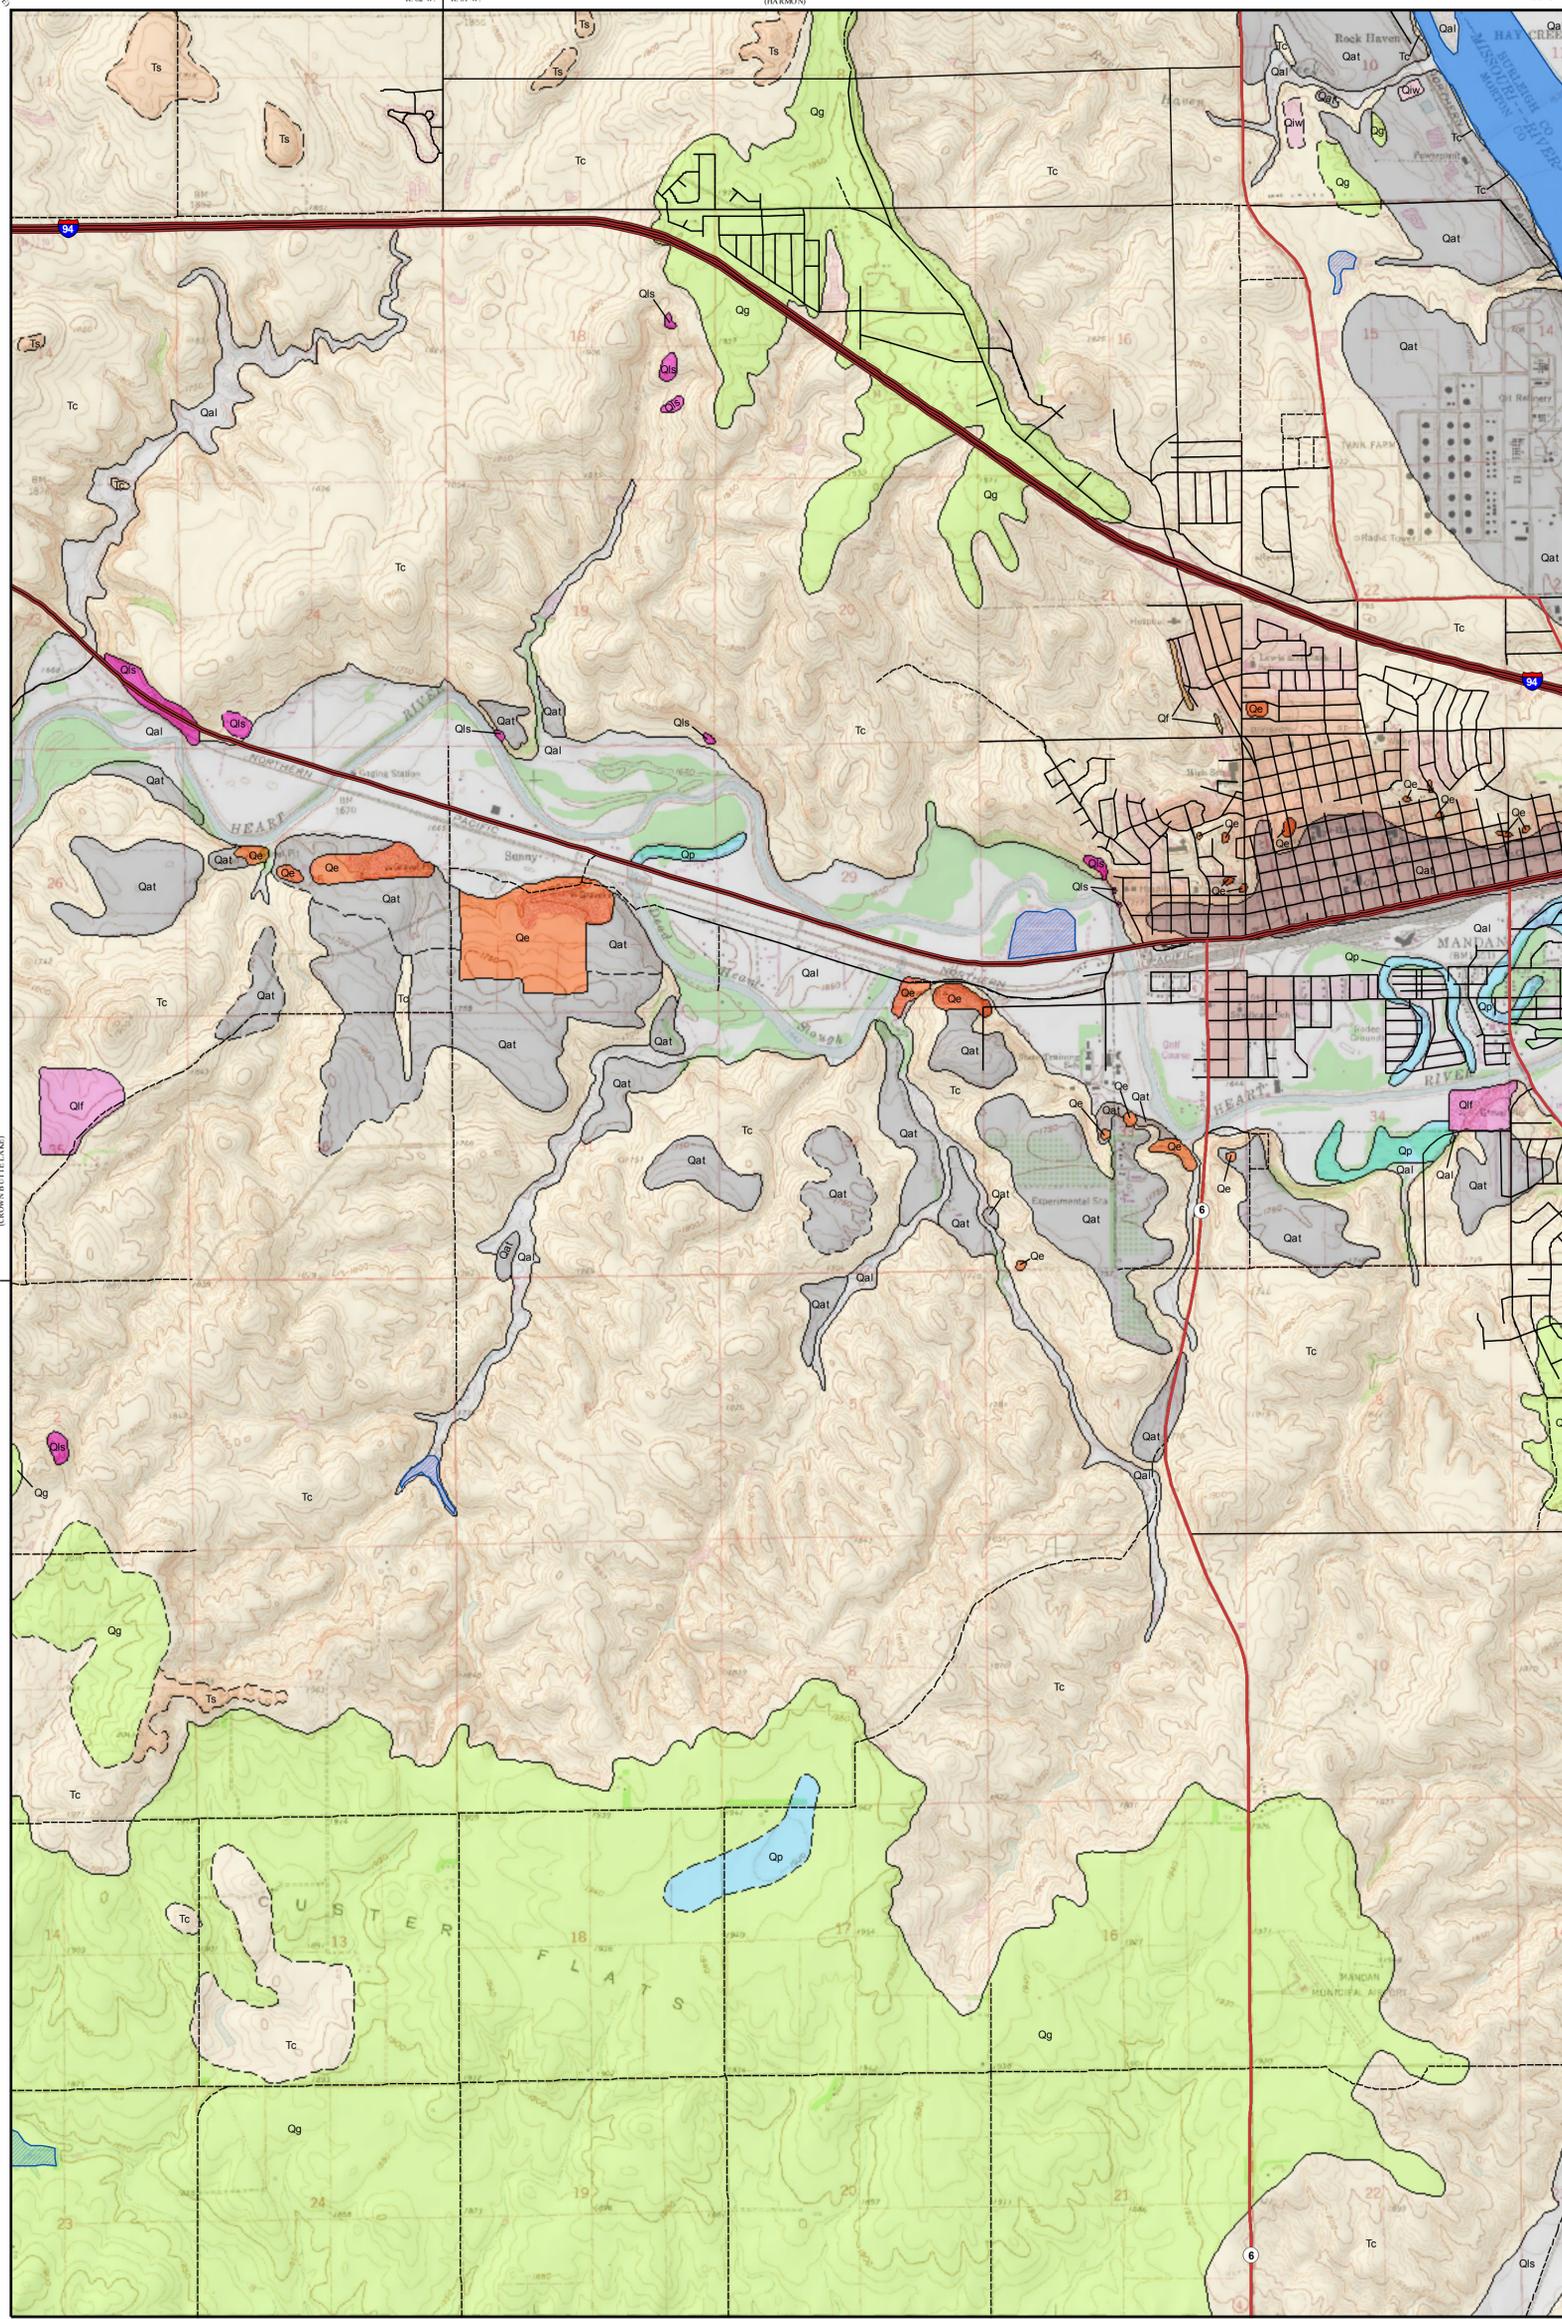

- Ts** **SLOPE FORMATION**
Consists of approximately 100 feet of alternating yellowish brown to grayish brown colored beds of sandstone, siltstone, mudstone, claystone, and lignite.
- Tc** **CANNONBALL FORMATION**
Consists of 300 feet of gray to black interbedded to shaly mudstone and fine grained, well sorted sandstone. The sandstone is typically poorly cemented but does contain several thin (less than 3 feet thick) well-cemented, lenticular lenses.

Geologic Symbols

- Known contact between two geologic units
- - - Approximate contact between two geologic units

Other Features

- Water
- Water - Intermittent
- Interstate Highway
- State Highway
- Paved Road
- Unpaved Road
