Source and Treatment

The Oliver, Mercer, North Dunn (OMND) Water Treatment Plant's (WTP) source is surface water obtained from the Missouri River at Renner Bay on Lake Sakakawea, about seven miles northeast of the treatment plant. The quality and condition of this water varies with lake level, spring runoff and other factors. SWA monitors regularly for offensive tastes and odors in the raw water, and reduces the taste and odor issues through the addition of ozone. From the Intake, the raw water is pumped to two raw water storage tanks, which are located at the OMND WTP site. The water is then treated using the following processes:

- *Prefiltration*, where water enters the treatment plant, and runs through the pretreatment filter screens. This helps to reduce any suspended solids or debris from entering the ultrafiltration (UF) modules.
- *Filtration*, where UF process primarily filters out any viruses and bacteria that may be present in the water by maintaining a 4-log removal.
- *Softening*, where the water coming off the UF process is piped to the buffer basin. A portion of the filtrate water from the buffer basin goes through the reverse osmosis (RO) process, which primarily filters out any inorganics that may be present in the water.
- *Blending*, where the permeate coming off the RO process is then blended at a 50/50 or 60/40 ratio with UF water within the contact basin.
- *Disinfection*, where at this point chloramines are added to reduce bacteria to a safe level, and provide a residual that protects against contamination.
- *Stabilization*, where caustic soda is added for a pH adjuster for corrosion control, and fluoride is provided for dental health.

After proper detention time and mixing, the water is then pumped through the distribution system to you, our valued customer.

SOUTHWEST PIPELINE PROJECT

About SWA's Quality Water

At Southwest Water Authority, our highest priority is your family's health where drinking water is concerned. With that thought in mind, we are pleased to report that our water system was in compliance with all drinking water regulations in 2022. We want you and all of our valued customers to be informed about our water utility, therefore if you have any questions about this report or any other concerns, please contact Grace Rixen, Water Treatment Manager or Ledeanna O'Shields, CFO/Office Administrator at 888-425-0241 or e-mail us at swa@swwater.com.

You are welcome to attend any of our Board meetings, which are generally held on the first Monday of each month. If you are interested in attending or would like to request agenda time, please contact us at the number listed above for information on time and location. If you are aware of non-English speaking individuals who need assistance with the appropriate language translation, please contact us at the number listed above. In order to allow individuals who consume our drinking water, but who do not receive water bills, to learn about our water system, we would appreciate it if our large volume water customers would post copies of this report in conspicuous locations or distribute them to tenants, residents, patients, students, and/or employees.

SWA's drinking water is monitored 365 days a year, 24/7 for it quality.

Southwest Water Authority

2022 Drinking Water Quality Consumer Confidence Report

OMND Water Treatment Plant

Southwest Water Authority's vision is "People and Business Succeeding with Quality Water." We take our responsibility of providing southwest North Dakota with a reliable supply of quality drinking water very seriously. Working with the North Dakota Department of Environmental Quality and the Environmental Protection Agency (EPA), we place drinking water safety at the top of our priorities. Our drive is to achieve a level of excellence that is unsurpassed in our field. To that end, we present our Annual Drinking Water Report. This report will provide information to our customers about the quality of our drinking water. It contains a table of water quality data, definitions of terms, specific language requirements, and other information we hope you will find useful and educational.

What is a Consumer Confidence Report (CCR)?

This CCR is our annual water quality report that all community water systems are required to provide to their customers. It is based on the 1996 Amendments to the EPA's Safe Drinking Water Act and the right to know provisions of that Act. As a customer of Southwest Water Authority, it gives you the opportunity to review your water quality annually. It also is provided to help you make informed choices about the water you drink. The report lets you know what, if any, contaminants are in the drinking water, and how they may affect your health.

SOUTHWEST PIPELINE PROJECT

DETECTED CONTAMINANTS

EPA requires us to monitor for over 90 drinking water contaminants and those that were detected are listed in the table below. Test results are from 2022. The State does allow reduced monitoring for certain contaminants because their levels do not change significantly over time. For this reason, some of the test results are more than one year old.

DEFINITIONS AND ABBREVIATIONS

Action Level (AL) – The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) – The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) – The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per billion (ppb) – 1 ppb is equivalent to adding 1 pound of a contaminant to 999,999,999 pounds of water (about 120,000,000 gallons).

Parts per million (ppm) – 1 ppm is equivalent to adding 1 pound of a contaminant to 999,999 pounds of water (about 120,000 gallons).

Picocuries per liter (pCi/l) – A measure of radioactivity.

Treatment Technique (TT) – A required process intended to reduce the level of a contaminant in drinking water.

N/A – Not Applicable

ND – Not Detected

NTU – Nephelometric Turbidity Units

Drinking Water Safety

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791). More information about drinking water is available on EPA's website at www.epa.gov/safewater.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control and Prevention (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

OMND TREATMENT PLANT'S TABLE OF DETECTED REGULATED CONTAMINANTS

Contaminant (units)	MCLG	MCL	Level Detected	Detection Range	Test Date	Exceedance or Violation?	Major Sources in Drinking Water
Microbial Contaminants							
Turbidity[1] (NTU)	N/A	TT = 0.3	0.02	N/A	2022	100% of samples met turbidity limit	Soil runoff
Total Organic Carbon (TOC) Removal							
Alkalinity (ppm) Source Water	N/A	N/A	175	159-175	2022	N/A	Natural erosion, plant activities, and certain industrial waste discharges
Total Organic Carbon (ppm) Source Water	N/A	TT	3.91	3.13-3.91	2022	N/A	Naturally present in the environment
Total Organic Carbon (ppm) Finished Water	N/A	TT	1.92	1.43-1.92	2022	N/A	Naturally present in the environment
Inorganic Contaminants							
Arsenic (ppb)	0	10	1.01	N/A	2019	No	Erosion from natural deposits; Runoff from orchards; Runoff from glass and electronics production wastes.
Barium (ppm)	2	2	0.0198	N/A	2016	No	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Copper (ppm)	1.3	AL = 1.3	0.225	N/A	2022	No sites exceeded the Action Level	Corrosion of household plumbing systems; Erosion of natural deposits
Fluoride (ppm)	4	4	0.77	N/A	2016	No	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Lead[2] (ppb)	0	AL = 15	1.09	N/A	2022	One site exceeded the Action Level	Corrosion of household plumbing systems; Erosion of natural deposits
Nitrate-Nitrite (ppm)	10	10	0.036	N/A	2022	No	Runoff from fertilizer use: Leaching from septic tanks, sewage; Erosion of natural deposits
Disinfectants							
Chloramines (ppm)	MRDLG = 4	MRDL = 4.0	3.4	3.2-3.48	2022	No	Water additive used to control microbes
Disinfection Byproducts							
Total Haloacetic Acids (ppb)	0	60	11	5.6-9.81	2022	No	By-product of drinking water disinfection
Total Trihalomethanes (ppb)	0	80	16	6.47-20.21	2022	No	By-product of drinking water disinfection
Radioactive Contaminants							
Gross Alpha, including Ra, excluding Rn & U (pCi/l)	15	15	ND	N/A	2018	No	Erosion of natural deposits
Radium, Combined (226, 228)(pCi/l)	0	5	0.691	N/A	2018	No	Erosion of natural deposits
Uranium, Combined (ppb)	0	30	ND	N/A	2018	No	Erosion of natural deposits

SOUTHWEST WATER AUTHORITY'S TABLE OF DETECTED UNREGULATED CONTAMINANTS[3]

Contaminant (units)	MCLG	MCL	Level Detected	Detection Range	Test Date	Exceedance or Violation?	Major Sources in Drinking Water
Alkalinity, Carbonate	N/A	N/A	7	ND - 7	2022	N/A	N/A
Bicarbonate as HCO3 (ppm)	N/A	N/A	213	182-213	2022	N/A	N/A

[1] Turbidity is a measure of the cloudiness of the water. It is monitored because it is a good indicator of the effectiveness of our filtration system.
[2] If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Southwest Water Authority is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. **Use water from the cold tap for drinking and cooking. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking.** If you are concerned about lead in your drinking water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.
[3] The EPA requires testing for certain unregulated contaminants, but has not established enforceable drinking water standards for them. They are monitored to determine whether or not future regulation is warranted.

CONTAMINATION SOURCES

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- **Microbial contaminants,** such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants,** such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- **Pesticides and herbicides,** which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- **Organic chemical contaminants,** including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
- **Radioactive contaminants,** which can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

As part of a nationwide program, the North Dakota Department of Environmental Quality completed an assessment of the OMND's source water and determined that our water system is moderately susceptible to potential contaminant sources. They also noted that "historically, Southwest Water Authority has effectively treated this source water to meet drinking water standards." Information about Source Water Assessment can be obtained by calling 1-888-425-0241, or e-mailing us at swa@swwater.com.
